User Tasks
Nov. 18, 2016

Since we have two distinct sides of the application, we decided to create two sets of user testing tasks.

Nurse:

Overview:

Pretend that you are a nurse coordinator, in charge of managing a team of nurses. You decide to use Share in order to better manage your patients.

1. Open the application and begin the setup process by creating a new account.
2. Now, assume your boss gives you a new patient to manage with the unique ID: 1. Insert the patient's preliminary data into the application to begin tracking their history.
3. As a nurse, this application attempts to present information of the priority (critical or non-critical) level of your patients to help you manage and prioritize resources. Find the patient or patients who currently have the highest priority status.
4. Please experiment with the application. For instance, view the past history of some of your patients or write a note about a patient.

Caregiver:

Overview:

Assume you have been designated the primary caregiver of a person in hospice care. Your contact nurse tells you about this new application that will help assist in the communication between you and the nurse team to keep up to date on news.

1. Open the application and sign-up using your patients unique ID: 1 that your contact gave you.
2. As part of your role as a caregiver, the application requires that you complete a daily assessment of your patient's health. Complete your first assessment using pretend answers for each question.
3. Assume that you have used the application for several weeks and now wish to see your past assessments. Find one of your past assessments and view your past answers.
4. Please experiment with the application. Try to update your profile or contact your nurse.
